Ventilated façade

The façade is both the image of the building and the envelope that protects it from the elements. Thanks to its special features, the STON-KER® ventilated façade provides buildings with a wide range of technical and aesthetics benefits.

Aesthetics and durability

Colours, formats, stability, resistance, anti-graffiti, hygiene, water-tightness...

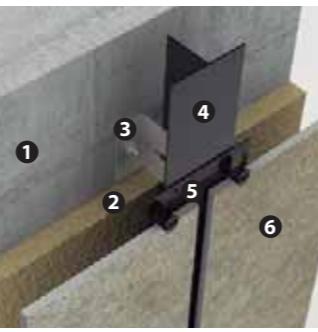

PORCELANOSA Grupo is at the forefront in terms of production, research and development and technical innovation in the ceramic tile sector. The group offers hi-tech products with excellent technical and aesthetic qualities, adapted to the needs of designers and architects.

Its range of colours, finishes, textures and formats in ceramic tiles is one of the most extensive on the market, and is suitable for cladding ventilated façades in any type of project and application.

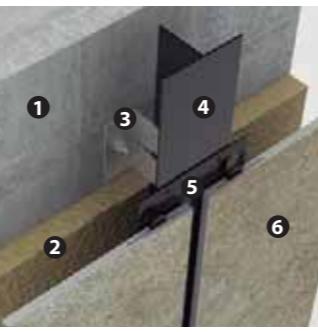

Special models can be developed based on the requirements, preferences and demands of our clients. The STON-KER® ventilated façade allows designers to present innovative projects and fully satisfy their requirements in terms of quality.

- Wide range of colours, finishes, formats and textures.
- Different layout patterns possible.
- High dimensional stability.
- Savings on space, increase of inhabitable surface.
- High durability of porcelain tiles: resistance to atmospheric agents; resistance to UV rays, which do not alter the appearance of the tiles with time; if necessary, the tiles can be replaced with other identical tiles (with the possibility of reproducing the same colour shades); resistance to thermal shock thanks to a low thermal expansion coefficient.
- Without grouting or sealing materials between the tiles, air gap ventilated through open joints (joint width of ≤ 8 mm.).
- Elimination of steam condensation thanks to ventilated air gap and installation of insulation material on the outside of the building envelope.
- Thermal insulation and supporting wall of the building protected from rain thanks to the reduced width of the open joints, the vertical position of the air gap and the solutions used for all of the construction details on the façade (mouldings, protective elements, etc.).

- Adaptable to the architectural style used.
- Resistance to cracks, abrasion, scratching, freeze/thaw cycles and impacts; tiles resistant to different impact classifications (special STON-KER® tiles).
- Minimum maintenance for façade, or not required: practically non-existent water absorption ($WA < 0.02\%$); non-porous; highly compact, with apparent density of 2400 kg/m³; anti-graffiti; resistant to chemical corrosion (METALIA series, class B); resistance to stains; resistance to microorganisms; hygienic.
- Prevention of problems associated with efflorescence or the appearance of damp on the façade.

Ventilated façade system with visible fixing clips

Ventilated façade system with concealed fixing clips

System components:

1. Supporting wall
2. Thermal insulation
3. Angle bracket
4. T profile
5. Fixing clip
6. STON-KER®

Energy savings and sustainable development

Considerable improvements in the thermal behaviour of the façade, by increasing the thermal resistance of the envelope or overall improvement in the performance of the façade, as well as many other benefits.

- Reduction of the thermal transmission coefficient (U) of the building envelope by increasing the thermal resistance by convection of the outer surface of the envelope.
- Easier installation of the insulation material on the outside of the existing envelope in renovations or new projects.
- Reduction of the heat flow caused by incident solar radiation in summer by up to 80%, thanks to the chimney effect created between the ceramic tile cladding and ventilated air gap. As a result of the air inside the gap heating up and causing low pressure inside the gap with respect to the external pressure, the hot air rises by convection, allowing cooler air from the outside to enter the gap through the open joints. Prevention of direct radiation on the supporting wall and drastic reduction of solar heating through the envelope. This means that the width of the existing air gap must be 20 mm or more between the rear of the tiles and the outer surface of the thermal insulating material.
- Elimination of thermal contacts at points where the edges of the floor slab connect with the vertical envelope, by installing thermal insulating material on the outside of the supporting wall, both in renovation projects or new building projects.
- Greater inertia of building envelope.
- More comfortable conditions inside the building.
- Reduction in heating requirements, and reduction in cooling requirements up to a certain point.
- Energy savings depending on local climate, direction of building and number of doors and windows in the building.
- Reduction in CO₂ emissions thanks to improved energy performance of the building.
- Reduced air noise thanks to the presence of open joints in the whole of the façade and the ventilated air gap.

- Porcelain tiles do not emit volatile organic compounds (VOCs).
- 100% recyclable natural product.

butech has evaluated the energy efficiency of the STON-KER® ventilated façade thanks to a thermal characterisation study carried out by the CIDEMCO Institute.

The policy of PORCELANOSA Grupo stands out for its commitment to supply products with the best possible service that fully respond to clients' expectations and demands, complying with applicable legal and environmental standards. With this aim in mind, PORCELANOSA Grupo has made a commitment to maintain its position of leadership in terms of quality and the compliance of its quality control system with the ISO 9001 standard.

Since it first began its industrial activity, the commitment of PORCELANOSA Grupo towards the preservation and conservation of nature and the environment as a whole has taken shape through ECOTECH, a series of ideas and actions applied to the environment. As a result, major investments have been made on a yearly basis in water supply systems, recycling waste materials, protecting the atmosphere and saving energy, or in certifying the group's environmental management according to the ISO 14001 standard.

Safety, protection and ease of installation

- Mechanical fixing system using visible or concealed clips to prevent the tiles coming loose.
- Structural anchoring system that isolates the façade from movements in the structure of the building, by allowing the two layers to move independently.
- Possibility of creating air gaps of different widths using angle brackets from 4 to 35 cm.
- Possibility of correcting envelope plumbness using a structural anchoring system to compensate for irregular wall sections.
- Fire resistance of glazed ceramic tiles EURO CLASS B-s2, d0 according to the BS EN 13501-1 :2002 standard.
- Impact resistance.
- Seismic resistance.
- Installation work causes minimum disturbance.
- Anti-fragmentation grid on the back of the tile.
- Light surround system. Full system weight less than 28 kg/m².
- Possibility of replacing the tiles independently.
- Complete, fast and simple construction details such as framed VSG, the crowning, etc.

The system has obtained favorable certifications such as the BBA Agreement Certificate 10/4775 in United Kingdom, the Florida Product Approval FL9364 in United States of America, the EMI certificate A-758/2006 in Hungary, ICC certificate in USA, the Spanish certification DIT 530 by the Eduardo Torroja institute or the certificate Avis Technique CSTB n° 02/10-476 in France.

This system, which has now been on the market for 15 years, is increasingly used in both renovation and new construction projects.

Residential building (Madrid - Spain)

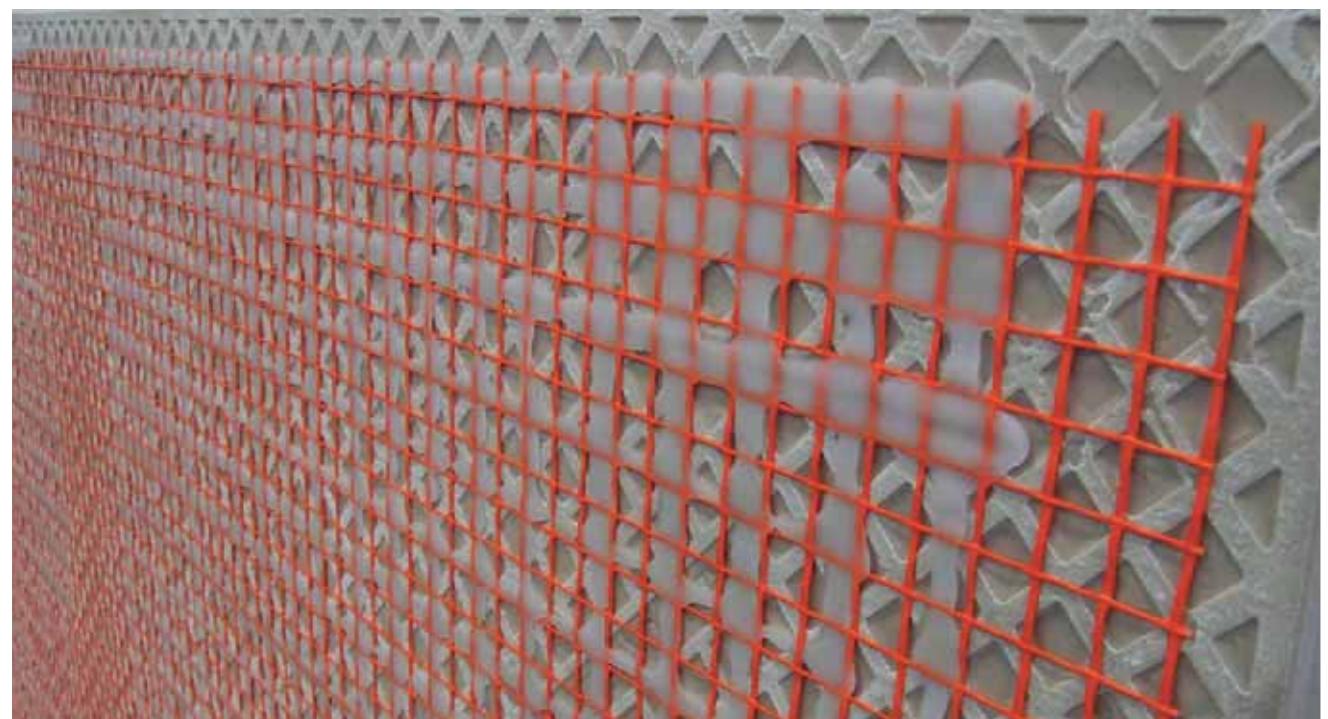

Technical features of ceramic tiles

PORCELANOSA Grupo produces its tiles at its factories in Villarreal (Spain), at the PORCELANOSA y de VENIS, plants, certified according to the ISO 9001 and ISO 14001 standards. The ceramic tiles are dry-pressed, glazed and completely vitrified, as per the BS-EN 14411 standard, with low water absorption – Bias Group ($\leq 0.5\%$).

NF-EN ISO	Test	ISO13006:1998 NF-EN 14.411:2006	Values STON-KER®	Values URBATEK

10545-12	Frost resistance	Required	Meets requirements	Meets requirements
10545-13	Resistance to acids and alkalis	According to manufacturer's data	GLA-GHA*	Depend on model
	Resistance to chemical products for domestic use and pools additives	Minimum class B	GA	UA
10545-14	Resistance to staining	Minimum class 3	Class 5	Depend on model

* Except Metalia series GLB-GHB

All the tiles are provided of an anti-fragmentation mesh on the reverse side. Visible and invisible fixing. When using the invisible fixing system, the tiles have slots cut into them in specific points. The slot has a characteristic tensile strength of 32 daN. Can be installed vertically or horizontally.

Façade renovation

The envelope of a building is the element that provides its image. Renovating a building envelope using a ventilated ceramic façade does not only result in an important change in aesthetic terms, but also improves the energy efficiency of the building. Using STON-KER ceramic material leads to minimum maintenance costs for building façades, providing a highly durable cladding system thanks to its characteristics.

The low absorption properties of STON-KER, combined with an open joint system, prevents the appearance of efflorescence on the façade. In terms of the energy savings that result from this system, by installing insulation material uniformly over the whole façade it is possible to eliminate thermal bridges that appear on the edges of floor slabs and pillars.

Also, thanks to the airflow generated inside the gap, condensation is prevented and the thermal-acoustic insulation material is kept dry, improving its efficiency. In summary, investing in a ventilated façade changes the appearance and functional performance of a building's outer envelope, making it easy to maintain and very long-lasting.

Advantages

1. The three-dimension motion freedom of the system in conjunction with the flexibility of the aluminum used in its manufacturing, allows our Ventilated Façade system to avoid the structural movements of the building to affect directly the finish of the facade.
2. As the ventilated façade system creates an air gap, wiring and other elements can be concealed inside it. The air gap created between the tiles and the structure in our ventilated façade system can be used to conceal wiring and other elements in its interior.
3. The ventilated air gap also helps to solve existing problems affecting the building such as leaks, unventilated areas, noise, deterioration of the thermal insulation, etc. Refurbishments on the old facade can be carried out without aesthetic worries as it will be later covered by the Ventilated Façade. Any moisture that is present dries quickly thanks to the airflow inside the gap due to the chimney effect. This means that the useful life of the façade materials is considerably extended, and that the existing construction systems are not damaged.
4. The Ventilated Façade uses a mixed cladding system, with adhesive and mechanical anchors to ensure that the tiles are fixed firmly in place while direct bonding leads to risks such as incorrect laying or use of the adhesive material.
5. Being a projected facade, the system allows to conceal any shape irregularity in the building that makes the completion of the project much faster than the bonded fixing systems. Irregularities of 10 cm (3 15/16") or more between the deepest and highest point of the facade can be absorbed.
6. A especially important aspect is that the ventilated façade can be installed quickly on buildings that are in use, when completion times have to be as short as possible.
7. The ventilated façade system makes it possible to resolve all contact points, details and surrounds quickly and easily, either using ceramic tiling or aluminium.
8. Thanks to the wide range of formats 120x59.6 (23.5"x47 1/4"); 66 x 44 (175/16"x25 16/16"); 59.6 x 59.6 (23.5"x23.5"); 90 x 45 (171 1/16"x357/16") ; 90 x 60 (171 1/16"x235/8"), etc. and the possibility of cutting pieces to measure on site, it is easy to find a format that adapts to the shape of the building, reducing wastage to a minimum.
9. Ceramic tiles remain unaltered over time by atmospheric agents, are graffiti-proof, do not require maintenance and have an absorption factor of less than 0.02%, making them ideal for this type of use.
10. The ceramic ventilated façade is a light envelope solution, as it weighs less than 30 kg/m^2 (711.91 lb/ft²), only placing a small load on the existing building structure.
11. Efflorescence on the façade is prevented thanks to the open joint between the sections, and the low absorption of the ceramic tiles.

Ventilated Facades XLIGHT

XLight is a new type of extremely thin, large format porcelain tile, which is achieved thanks to the use of the latest technological advances in ceramic production.

This material's technical features make XLight the perfect ally for achieving fully integrated designs, allowing for the creation of facades of great beauty, thanks to the collaboration of several companies from PORCELANOSA Group.

It is available in two 3 mm thick formats, 300 x 100 cm and 100 x 100 cm, back-reinforced with a fiberglass mesh that enhances the slab's flexural strength.

The large size of this type of porcelain tile, its zero water absorption, its resistance to atmospheric agents, its lightness with less than 10.5 kg/m² as well as its design, make the XLIGHT slabs an excellent solution for all types of facades.

Features:

Thickness	ISO 10545-2	3.5 ± 5% mm
Surface flatness	ISO 10545-2	0.1 %
Water absorption	ISO 10545-3	< 0.1 %
Flexural strength	ISO 10545-5	> 120 N/mm ²

Metal substructure.

Load-bearing substructure of the ventilated facade, as per DIT 530/11. It is made up of the following elements:

Aluminum separators for transmitting loads from the substructure to the supporting wall through anchors. Available from 60 mm to 160 mm in length. Depending on the type of stress they bear, there are two types of anchors: primary and secondary.

Vertical substructure of aluminum sections for installing XLIGHT slabs. Available in T-shaped sections (100 mm width) or L-shaped sections (40 mm width).

Features:

Tensile strength (Rm)	≥ 270 N/mm ²
Yield strength (Rp 0.2)	≥ 225 N/mm ²
Elongation (A)	≥ 8 %
Brinell Hardness	90

The substructure's anchoring system depends on the type of substrate used in the project. The site management and the installing company shall be in charge of this.

Anchoring system

Mechanical anchors.

Clips for mechanical anchoring, as per DIT 530/11 design 11. Manufactured in AISI 304 stainless steel and 1 mm (± 0.15) general thickness, they can be supplied lacquered in the RAL color that the customer needs.

There is a wide range of different clips available, which adapt to all facade anchoring needs.

p-404

Polyurethane adhesive. It polymerizes in contact with environmental moisture, forming an extraordinarily elastic and adhesive elastomer.

Specially recommended for bonding ceramic on metal sections. Indoor and outdoor use

Features:

Tensile strength (Rm)	510 - 750 N/mm ²
Yield strength (Rp 0.2)	≥ 230 N/mm ²
Elongation (A)	< 45%
Brinell Hardness	183

Features:

- Type B-1 as per UNE 53622
- High adherence and elasticity.
- Resistant to UV-rays and frost.

XLIGHT Tools

Handling, cutting, and installation of XLIGHT ceramic requires special tools. These tools are designed for pieces with a format of up to 3,000 x 1,000 mm and thickness of little more than 3 mm. The essential tools for installing XLIGHT ceramic are the following:

XLIGHT Frame / carrier.

Aluminum structure of up to 300 cm long, equipped with suction cups for moving large-format pieces.

Cutting guide plus XLIGHT pincers.

Tool for cutting XLIGHT ceramic straight, plus pincers for separating marked pieces. It includes diamond point.

Notched trowel and XLIGHT rubber trowel.

Notched trowel with 10 mm sloped serrations which facilitates uniform spreading of the adhesive, plus rubber trowel for pressing XLIGHT ceramic on adhesive.

In addition to using the appropriate tool, the following handling instructions are recommended:

- Use protective gloves.
- Handle the slabs in groups of at least two people.
- Avoid rough movements.
- Avoid bending the slabs by the middle.
- Protect corners with plastic corner protectors.
- Transport slabs perpendicular to the ground.
- Do not stand slabs directly on the floor.
- Place the long side over soft material strips (wood or styrofoam) and stand the short side of the slab on a firm support.
- Before stacking the slabs, clean off any element that may scratch the surface.

Self-leveling spacers.

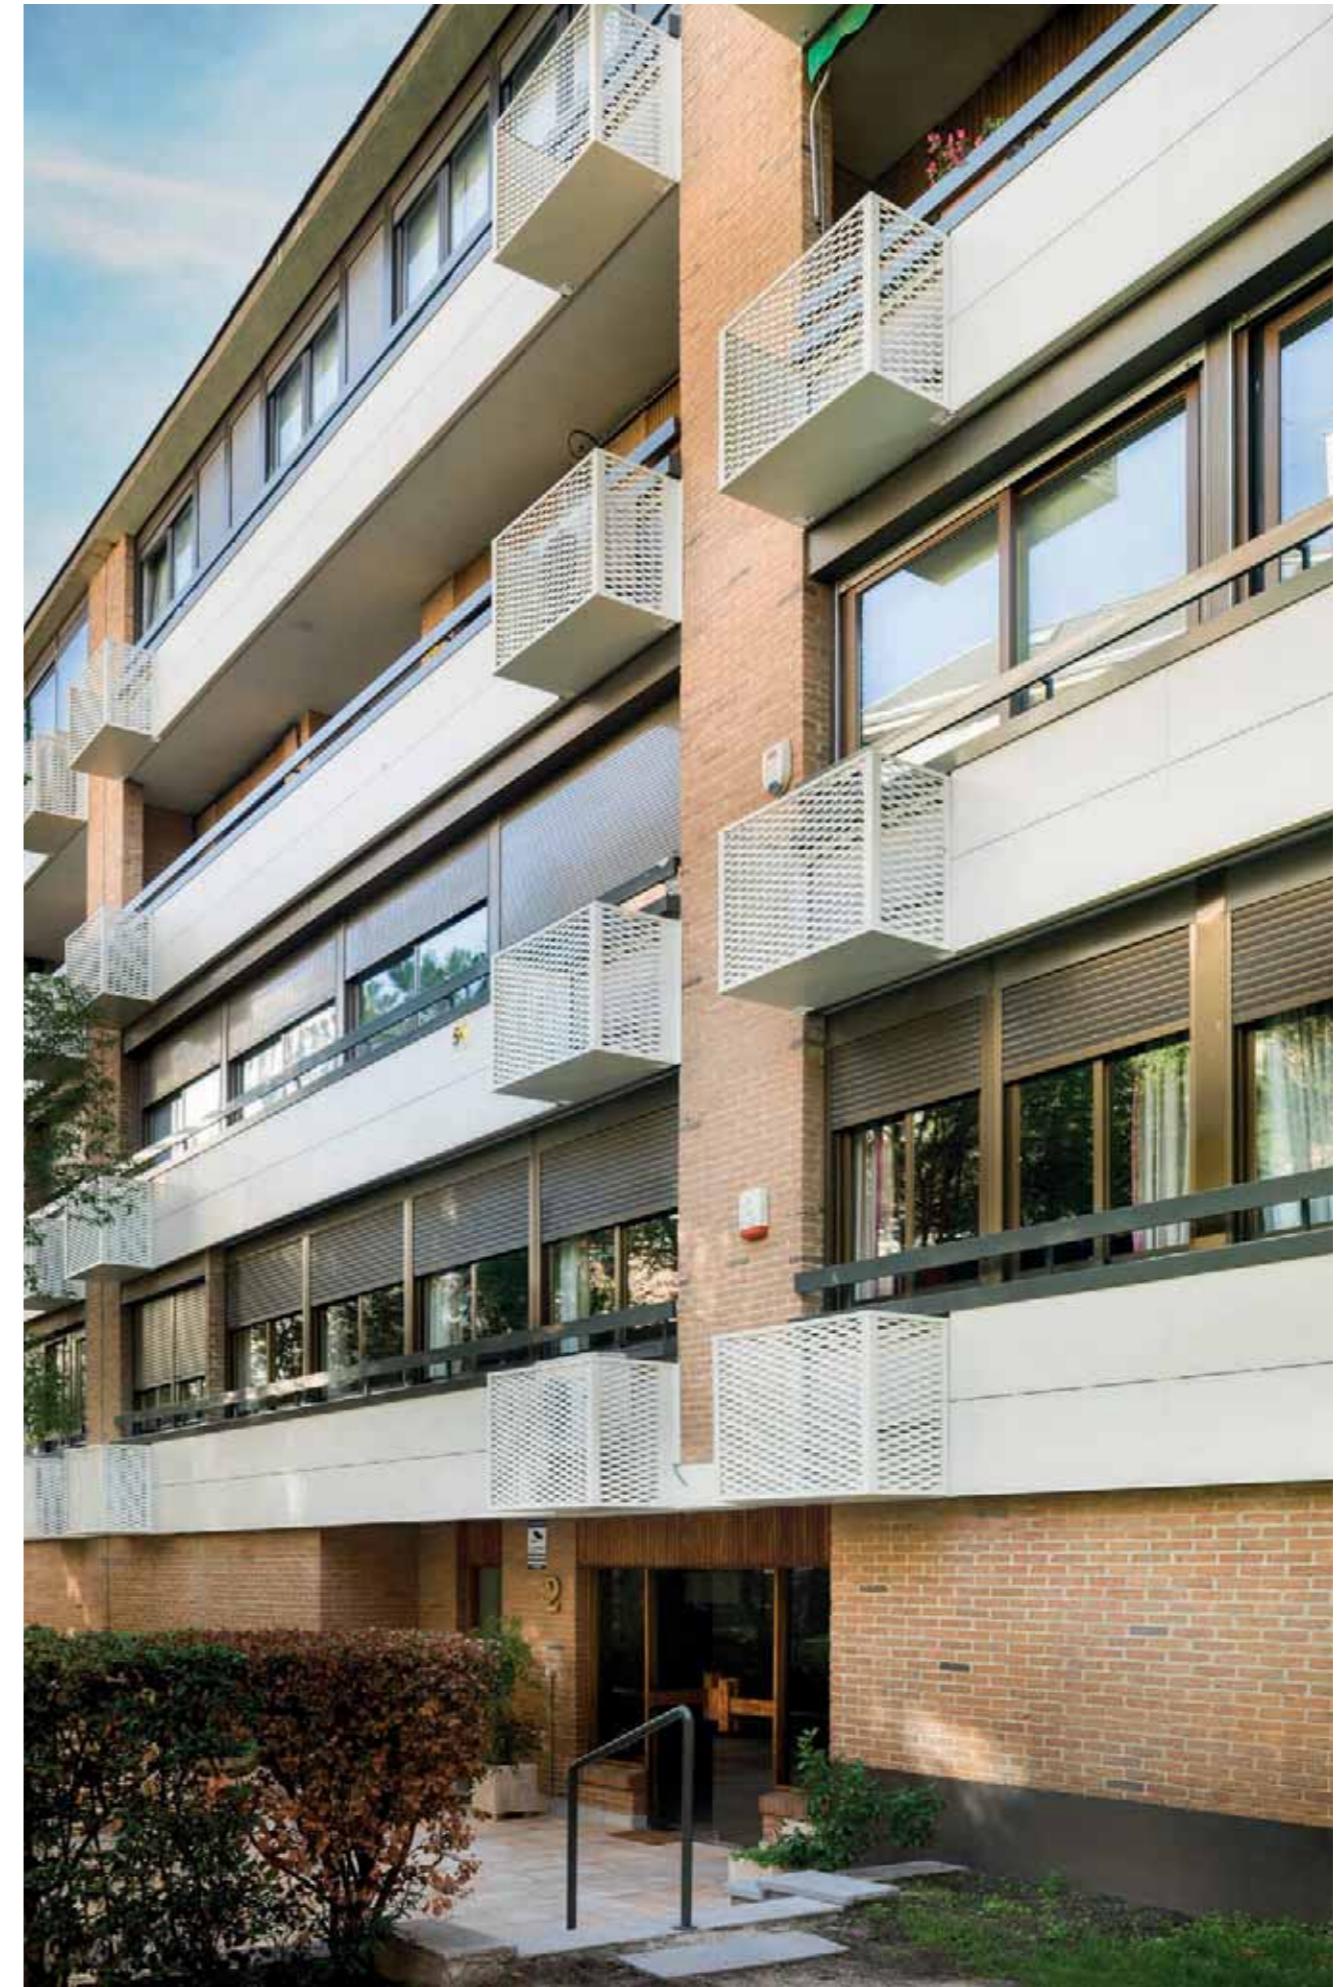

Spacers are essential when installing quality ceramic; they make work easier and ensure uniform width joints.

There are self-leveling spacers currently available that facilitate the leveling of the wall covering and avoid ledges between tiles. A special tab has been designed for installing XLIGHT slabs that protects and facilitates the assembly, even with 3.5 mm thick slabs.

Modular system

Butech's modular system is an innovative lightweight façade construction system, which by the quickness of its installation, and its contribution to the building's energy efficiency, make it a system that adds value to the finished product, for a price lower than traditional construction.

Composition

The system is made up of two outer SECUROCK PANEL panels and an inner core consisting of three 4 cm thick insulation layers, thus achieving the highest energy efficiency performance for your building.

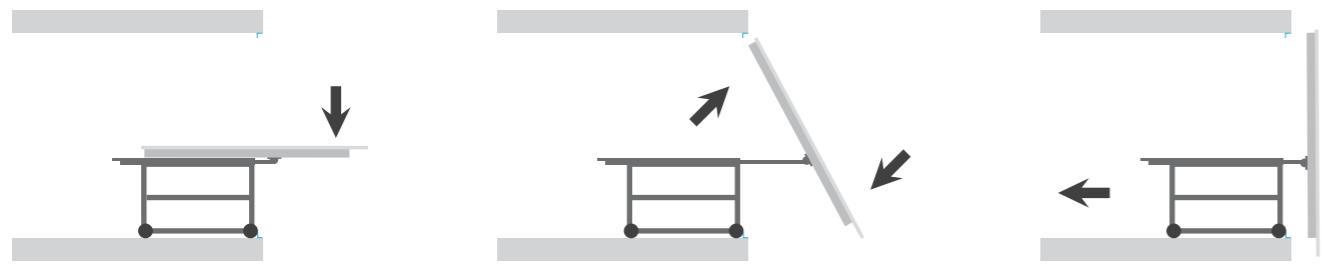

It is supported by a tubular steel structure that anchors the panel to the building structure.

Advantages of the system

Quick installation.

Thanks to its lightness and assembly simplicity, the modular system achieves a full finished facade installation speed that adapts to the needs of any project.

The modular system provides a reduction in construction times that is superior to any traditional constructive system, achieving productions of 3 m²/man hr, per installation equipment.

Auxiliary means are not needed and waste is not produced.

Using a crane or scaffolding is not required as it is assembled from the inside of the building. Being a prefabricated product tailored to your work, it does not need to be machined.

Energy efficiency.

Butech's modular system is made up mostly by insulating material, thus achieving the highest energy efficiency performance for your building.

100% Recyclable

The system components are entirely recyclable, guiding your construction towards sustainable construction.

Certificates

Butech's modular system has been certified by the Applus laboratory, having obtained the highest qualifications provided for in the CTE for curtain walls.

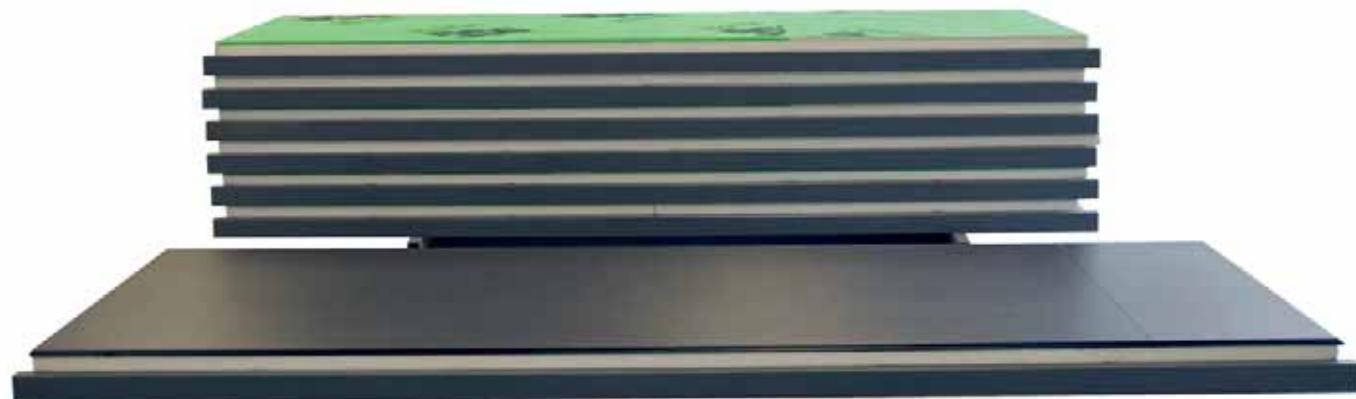

Air permeability, water tightness, and resistance to wind load.

Flammability.

Acoustic insulation against air noise.

SATEc system

The butech SATEc system is an Exterior Thermal Insulation system using exterior wall tiles from the PORCELANOSA Group. The system combines the technical features of the SATE systems with the natural surface quality of AIRSLATE from L'ANTIC COLONIAL.

Structure

The SATEc system consists of the following materials:

Preparation of the support.

Thermocem is a single-component cementitious mortar, modified with polymers for the bonding and plastering of exterior polystyrene thermal insulation systems. Characteristics:

- Compatible with XPS polystyrene panels
- Excellent tensile strength

Thermal insulation

SATEc XPS panels 1250 x 600 extruded polystyrene panels are designed for the thermal insulation of facades. They have a ribbed surface for a better mounting of the protective layer. Available in panels of between 30 to 120 mm thick. Characteristics:

- Low coefficient of thermal conductivity
- Direct placement on the support; without the need for a supporting structure.
- High tensile strength and compression resistant.
- CE designation code: T1-S (10/Y) 300-DLT (2) 5-DS (TH) -WL (T) 0.7-WD (V) 3-FT2

Bonding material

super flex S2 is a high performance powder free adhesive, suitable for the installation of all types of ceramic tiles on the most common supports used in construction. Specially recommended for the installation of large format, thin porcelain tiles such as XLIGHT by URBATEK. Characteristics:

- Maximum adhesion and deformability.
- Lightweight adhesive. Economical in use on site
- High initial adhesion without vertical sagging or slippage. Thixotropic
- Certified to standards (EN 12004): C2 E S2

Accessories

The SATEc installation system involves the use of a large number of profiles and complementary anchors. These include the following important components.

- SATEc panel anchors. Traversing the thickness of the panel they are anchored to the support. They support the weight of the facade.

System characteristics

This system has many advantages.

- PORCELANOSA Group exterior ceramic wall tiles
- Reduce the energy consumption of the building, thereby reducing the consumption of fossil fuels and emissions of CO₂.
- Eliminate thermal bridges, particularly the forged type.
- Reduces thermal variations in the structural elements of the building, avoiding thermal shocks.
- Prevents the formation of condensation on the inside of the building.
- Protects the facade against cracks and possible moisture penetration
- A simple and easy to install system.
- Particularly suitable for rehabilitation:
 - Renews the appearance of the building.
 - Reduces building energy consumption by up to 50%, allowing a quick return on investment.
 - Improves the energy rating of the building.
 - Does not reduce the usable area of the building.
 - Does not prevent the use of the building during rehabilitation.

Types of exterior wall tiles

AIR SLATE Panels

THE AIR SLATE from L'ANTIC COLONIAL is a new collection of natural slate sheeting for covering large spaces quickly and easily. Available in panels of 120 x 240 cm and a thickness of between 2 and 4 mm. This type of natural stone panel, ideal for large spaces, is supplied with a protective film on the back to strengthen its technical characteristics:

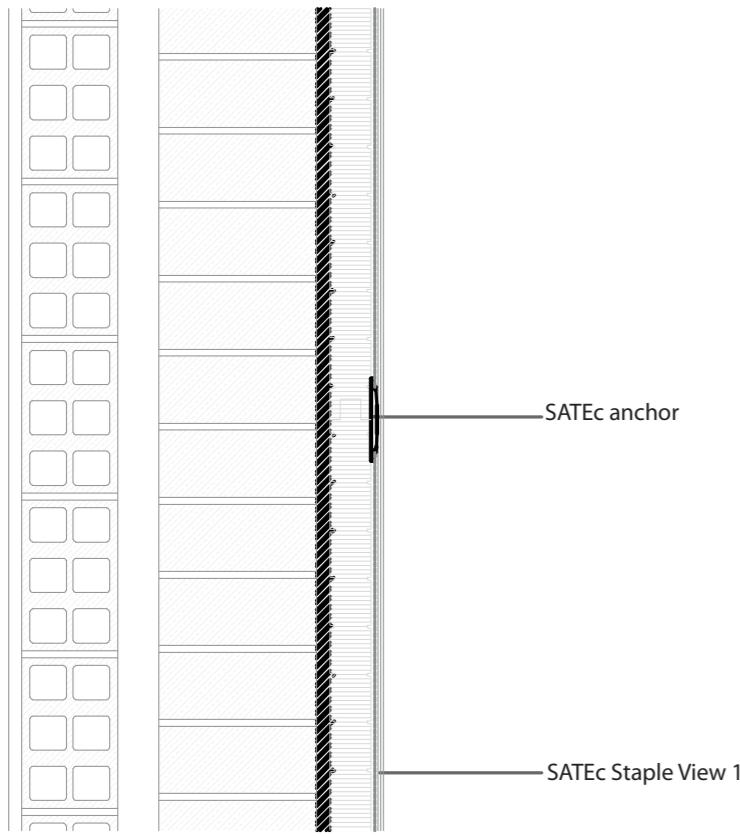

- Extremely lightweight: 4 - 4.35 kg / m²
- No water absorption: less than or equal to 1.5%
- Flexural strength: 102.2 MPa
- Reaction to fire: C-S2, d0
- Ease of cutting and handling.

This material is available in various types of finish: Metal, Bombay, Delhi, Kathmandu, Forest, Kashmir and Graphite. The panels of this natural ultrathin slate are supplied in sheets of 120 x 240 mm

Ventilated façade & KRION Lux

KRION® is a product that is solid, compact, pore-free, with uniform properties throughout its section, and which can be transformed to obtain figures and complex volumes. The KRION® surfaces employed by butech have high resistance to temperatures and chemical agents, are easy to clean and maintain, and offer warmth and beauty, making these solid surfaces ideal for the most demanding applications.

Unlike other materials used professionally, it can be injected, cut, machined, and glued, achieving invisible joints. This property allows designs to freely incorporate functionality and ergonomics criteria which would be otherwise difficult to obtain.

Features

KRION® is a new generation solid surface developed by SystemPool, a company from the PORCELANOSA Group. It is a product that is warm and velvety to the touch, similar to natural stone, solid, with a uniform mass, non-porous, available both in slabs and in molded figures, and that allows for an invisible joint between the different pieces.

This product is also hygienic, unreactive, non-toxic, virtually fireproof, easy to maintain and repair, it has multiple transforming possibilities, and a high resistance to chemical agents, water vapor, or the weather.

Advantages

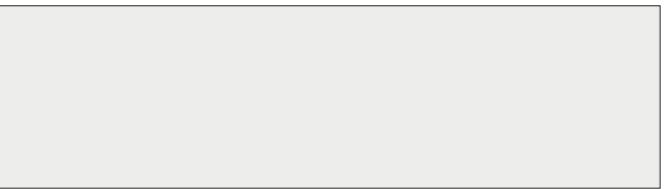

- Anti-graffiti.
- Fire-resistant.
- Resistant to cigarette burns.
- Eco-friendly.
- Antibacterial (no additives).
- Great durability.
- Resistant to high temperature.
- High degree of hardness and mechanical strength.
- Moldable.
- Large surfaces without joints.

Maintenance

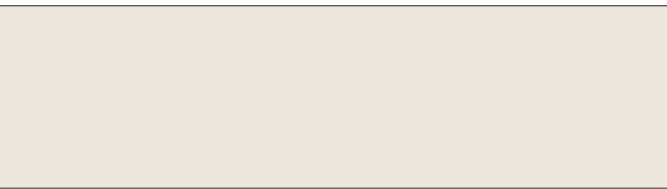

In order for the material to regain its initial state, butech recommends to strictly follow the manufacturer recommendations for cleaning tough stains, which are to rub the surface using a green fiber Scotch-Brite® scouring pad. This way the tough stains will disappear, so that any cleaning team will be able to carry out these maintenance tasks without needing to resort to more sophisticated items or special cleaning agents.

It can be entirely restored, which means that it can return to its original appearance. Even cigarette burns can be removed with a normal detergent and a scouring sponge.

Properties

Anti-graffiti

Graffiti can be completely removed after they have been made on the surface, and regardless of the time passed since they are made, by using a Scotch-Brite® type scouring sponge.

Fire resistance.

Fire-resistance rating is B-s1, d0 according to the UNE-EN 13501-1: 2002 standard; this classification corresponds to Flame retardant material. (It is equivalent to classification M1 according to UNE 23727:1990 standards).

Considering the Spanish Technical Building Code (CTE), the Euroclasses A1, A2, and B, correspond to the non-combustible and low combustibility product classes. They represent those construction products which are safer in terms of fire safety.

Documentation: Tests from the Technical Fire Center 1010100-01 CL.

Cigarette burn resistance.

Cigarettes are consumed 10 mm, and are then deposited on the material until 20 mm more are burned up. They are then removed, and the stain they leave is perfectly removed using a scouring sponge.

Documentation: Tests in accordance with UNE-EN 438-2: 2005 standards.

Resistance to solar radiation.

The temporal equivalence of artificial aging results is not empirical, although correlations can be established between this study and the results obtained from 10 years of natural aging in the area of Valencia.

Artificial aging tests consisting of a total of 12 extreme exposure alternate cycles, for a continuous period of 2016 hours, produce the following color material modification:

fv KRION® Pure Lux

Color variation: $\Delta E = 0.55$

This value corresponds to a variation that is very slight and practically unrecognizable to the human eye.

fv KRION® Stone

Color variation: $\Delta E = 5.24$

This value corresponds to a moderate color change and is only superficial, affecting 10 surface microns that can be removed using a Scotch-Brite® type scouring sponge, thus recovering the original color.

Therefore, material aging in the long run is minor, and it is possible to recover the initial appearance with basic maintenance.

Cutting and pasting

Chemical welding.

In first place, we must prepare the chemical welding kit. Once prepared, we shall join the slabs in a seam, so that the welding kit paste joins the two pieces. After joining the pieces, let dry.

Gluing.

Whenever we want to join edges, these should be straight or at 90° angles. Before applying the adhesive, the area should be cleaned with a cloth and methylated spirit; this way we will leave the area 100% clean. In order to achieve invisible joints, the use of KRION® adhesive is essential.

Linear cutting.

If we want to make linear cuts, we shall use a circular saw with hardened metal or diamond teeth.

Curved cut.

If we want to make curved cuts, we shall use a circular saw with hardened metal or diamond teeth.

Polishing and finishing

Polishing.

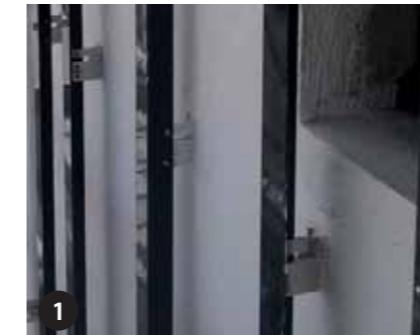

A random orbital sander must be used, with movements from top to bottom or from left to right.

Finishing.

The finishing, whether it is glossy or matt, can be done at the end of the work with sandpaper. This finishing can be chosen by the customer.

You can request more information at sistemas@butech.es

Assembly and installation

Fix the **butech** aluminium profiles.

When the **butech** aluminium profiles are in place, correctly aligned and plumb, screw the panels in place. To ensure secure fixing, the panels have inserts housing the KRION® aluminium clips.

After cleaning and drying the surface onto which the next panel will be chemically welded, a continuous line of KRION® liquid adhesive is applied to the inside groove of the panel.

Illustration of the prepared KRION® panels with adhesive.

Then insert the flange of the next panel in the groove, so that the KRION® adhesive overflows.

Install pressure clamps and ensure that the two panels are correctly bonded.

After a period of time remove the pressure clamps.

Then fix the insert caps using KRION® adhesive so that it overflows.

Ensure that the caps are clean and dry before fixing.

After 24 hours, surface sanding may be carried out to remove any roughness, marks or excess adhesive and obtain the KRION® final finish.

KRION® vf Façade System certificates and tests

Test list:

- Resistance tests to wind effects: report of CSTB tests no. CLC 12-26037368 of 07/03/2012.
- Resistance tests to wind effects after fatigue: report of CSTB tests no. CLC 12-26037925 of 14/03/2012.
- Impact resistance tests: report of CSTB tests no. CLC 12-26037369 of 19/09/2012.
- Insert pull-out resistance tests, flexural and tensile strength tests on the welded joints, in the initial state and after aging and heat + humidity: report of CSTB tests no. CLC 12-26037398/26037404 of 03/08/2012.
- Insert pull-out resistance tests, flexural and tensile strength tests on the welded joints, after ice / thaw cycles: report of CSTB tests no. CLC 12-26037400/26037404 of 03/08/2012.
- Reaction to fire tests: PV number 1010100-01CL and 1010122-01CL, carried out at the Institute AIDICO Technical Fire Center, in Spain.

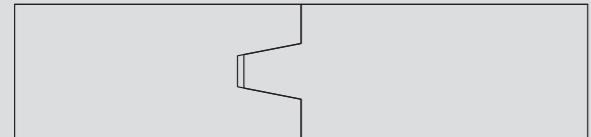

Done at the AIDICO Institute Technical Center Fire in Spain.

VF-Stone system

Private house
Arch. Joaquín Albert

VF-Stone system

butech and L'ANTIC COLONIAL show their most exclusive ventilated façade system, VF-STONE. A ventilated façade clad in natural stone offers a touch of distinction and natural warmth that other materials simply cannot achieve.

These types of stone - granite, marble, slate etc - have been used by man throughout history to adorn their finest architecture. They are exclusive products, conceived to stand out from all the rest.

Stone-clad ventilated façades offer all the advantages of natural stone, combined with reduced production and installation costs. They also offer all the benefits of a ventilated façade: energy efficiency, insulating the building from cold in winter, thanks to the air cavity between the façade and building; sound insulation; insulation from damp; and savings on maintenance costs.

Added to all this, stone is a timeless material. Natural materials benefit from the fact that they never become out of date. A stone-clad ventilated façade lasts a lifetime.

Components of the VF-Stone system

VF-STONE's system of profiles has been designed to meet all the necessary mechanical and anti-corrosion building requirements. This system of profiles can be installed on a solid, perforated or hollow support and it can be adjusted vertically and horizontally, thus complying with standard UNE 41957.

Its system of profiles is made up of vertical profiles, load-bearing brackets, support brackets and clips to hold the stone in place. The clips can be concealed or visible. Visible ones are used for foliated materials like slate.

Bonded façade

Ston-Ker bonded façades merge the beauty of a high-quality ceramic tile finish with other important aspects such as its lightweight, superior resistance to chemical and atmospheric agents, innovative design, and durability.

The Ston-Ker bonded façade system, which has already made its mark as an exterior cladding system, looks set to revolutionize façades for a long time in the future.

Advantages

The Ston-Ker bonded façade system offers the following advantages over other bonded façade systems:

- Greater resistance to damp
- Greater resistance to atmospheric agents
- Greater resistance to water
- Greater versatility in terms of tile size and arrangements
- No colour loss on façade
- Lightweight structure
- Minimum maintenance
- Anti-graffiti and self-cleaning properties.

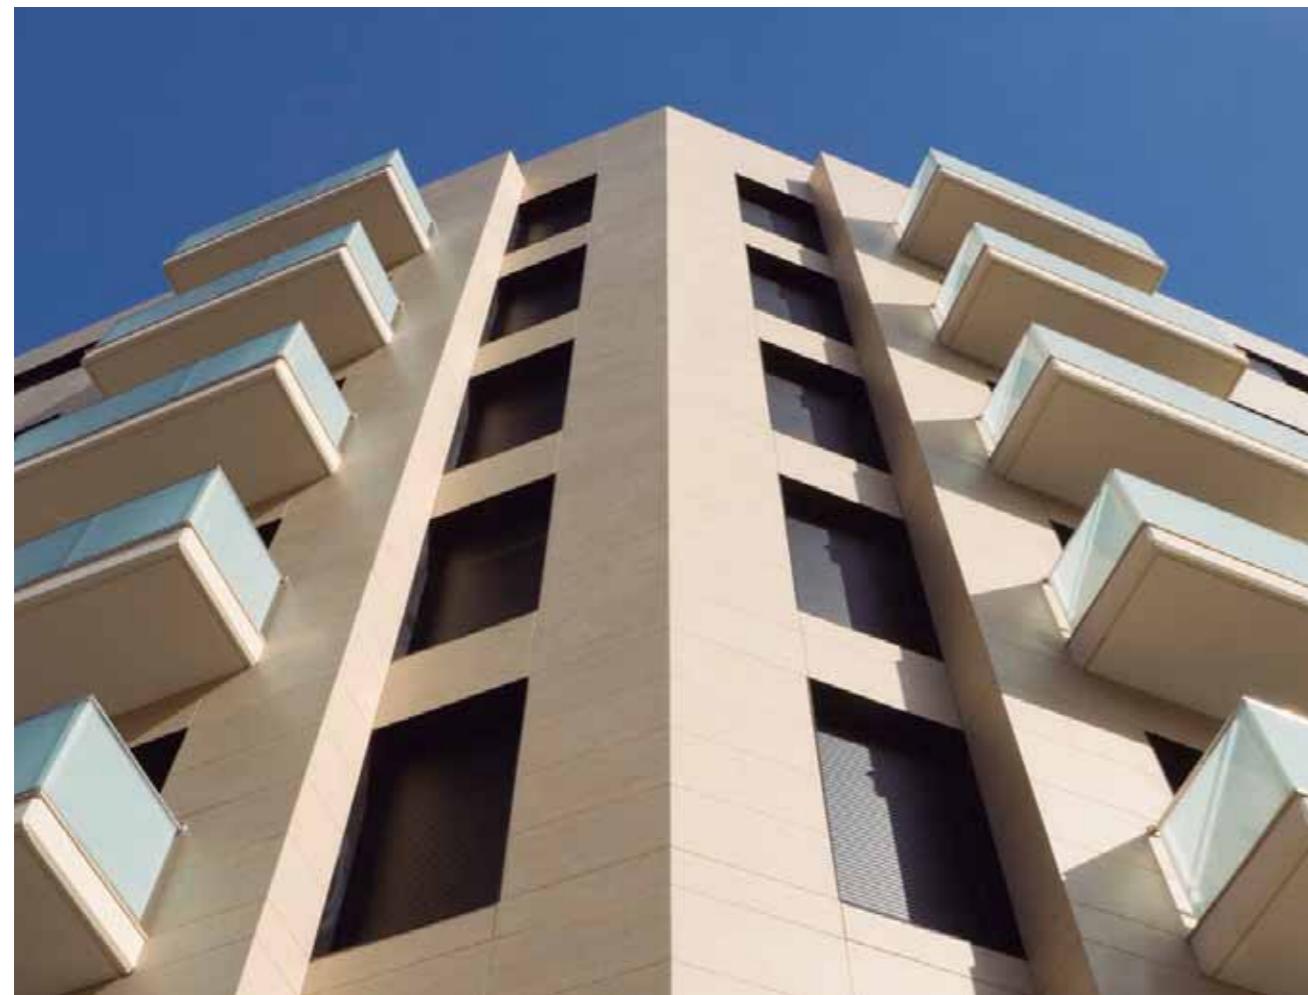

Concealed fixings bonded facade

Innovative concealed fixing clip for ceramic tiles in bonded facades. The fixings fit within small slots done on the porcelain piece and are anchored to the support by a stainless steel screw. Once the joints are grouted, the fixings are not visible anymore, not affecting the facade design.

Butech facade fixings have been designed as a security element in porcelain tile walls installed by the thin layer, double bonding method. We recommend the use of type C2 S2 cementitious adhesives as per EN 12004.

As a general rule, we recommend this kind of fixing from a height corresponding to first concrete slab. In any case, standards in force must be observed for every project.

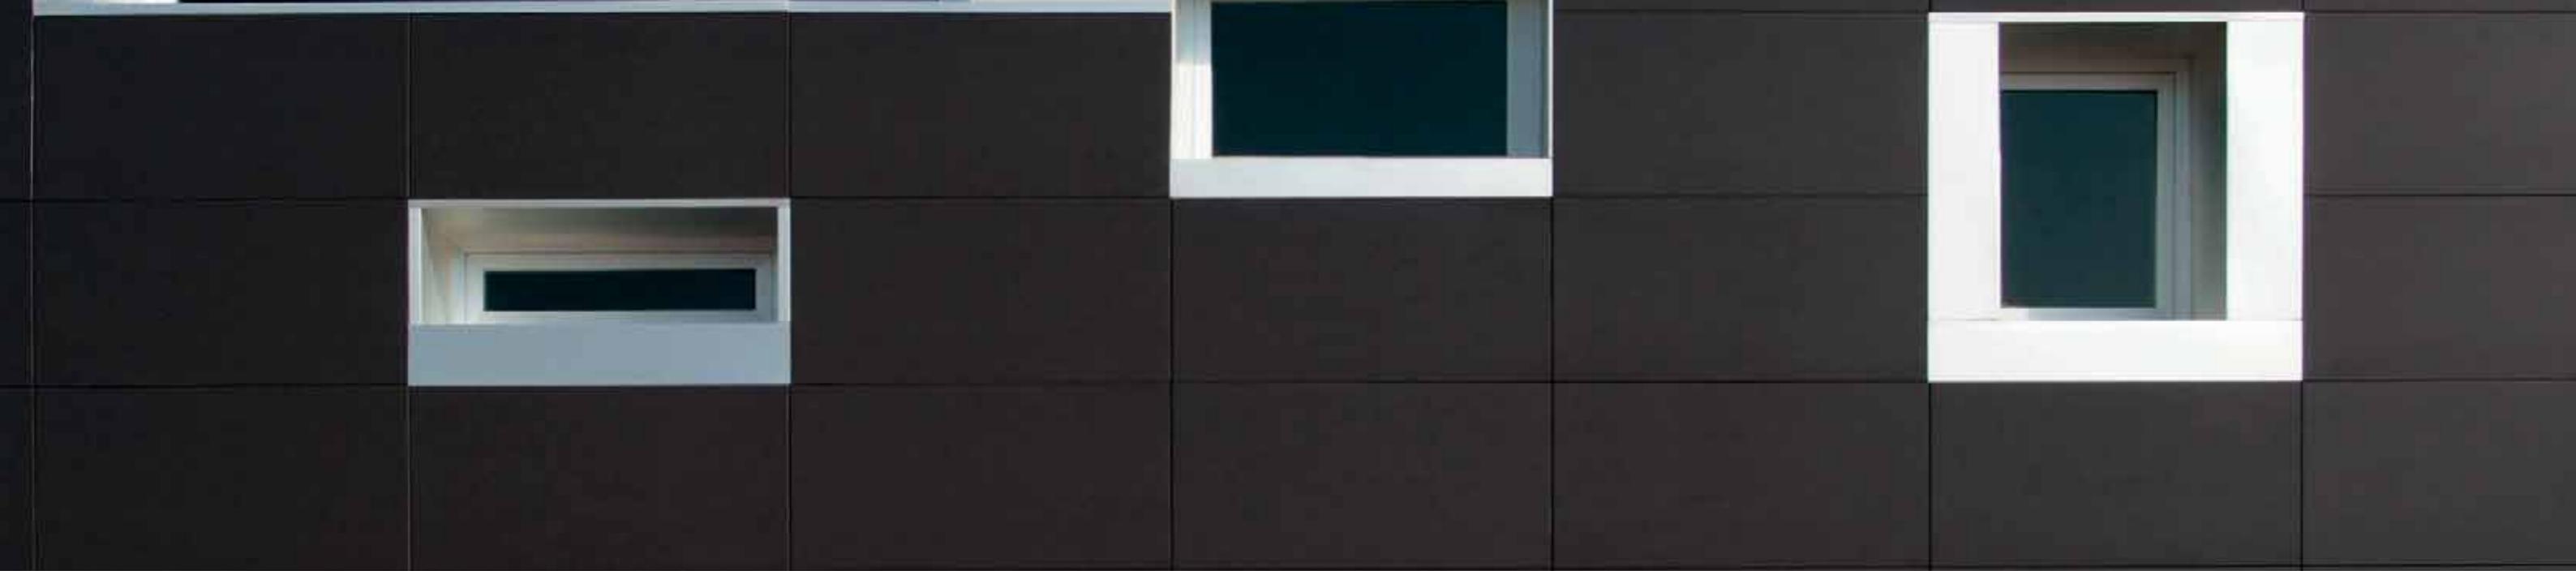

Visible fixings bonded facade

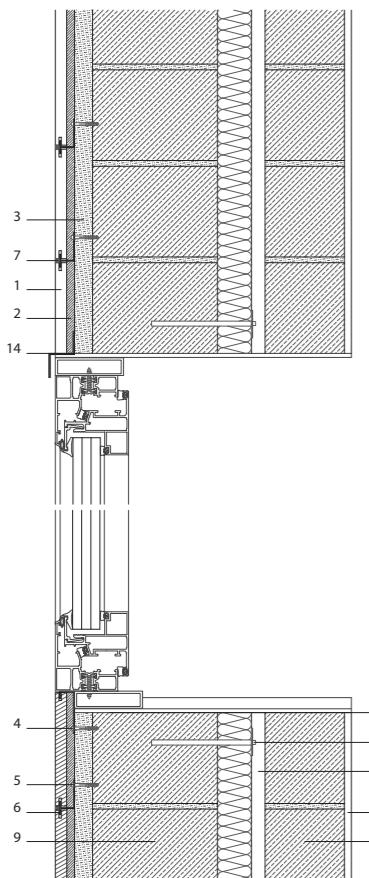

Visible fixing clip for ceramic tiles in bonded facades. Fixings hold the ceramic tiles and are anchored to the support by a stainless steel screw. Once the joints are grouted, the fixings are visible, and a 5 mm clip can be seen.

Butech facade fixings have been designed as a security element in porcelain tile walls installed by the thin layer, double bonding method. We recommend the use of type C2 S2 cementitious adhesives as per EN 12004.

As a general rule, we recommend this kind of fixing from a height corresponding to first concrete slab. In any case, standards in force must be observed for every project.

How to get a budget of a butech system?

- Come to one of our stores/ distributors, where you will be attended by our professionals, who will show you the products that best suit your needs.
- To provide you with the best service, you should provide us the plans of the project and fill a study sheet customized to your product.
- Once delivered the plans and the sheet correctly completed, from the Technical Department of butech, a first budget will be done.
- In less than 15 days, the same professional who attended you will deliver the budget.
- In case of acceptance, and if you wish, you will receive the visit of one of our technicians for the preparation of the final budget.
